Using [AngularJS](#) or the JavaScript framework of your choice please create a single page web application that allows a user to Create, List, Update and Delete customers. A customer is made of up the following attributes;

- Name
- Email
- Telephone
- Address
 - Street
 - City
 - State
 - Zip

The web application should use .json files as the storage mechanism for each customer record.

If you decide to use AngularJS, please read up on AngularJS and use their recommend approaches to defining the structure of the code.

Once you have completed the project, email me and we will set up some time to review. Please also email me the final project.

Any questions, please ask.

Thanks.
